From 2017 to 2019, the percentage of Rhode Island high school students using e-cigarettes increased dramatically from 20% to 30%, while cigarette use continued to decline. Nationally and in Rhode Island, tobacco use rates vary by race, ethnicity, and gender; and higher rates of tobacco use are found among youth who experience certain influencing factors. These factors include historic and emerging advertising trends, community acceptance, and social factors and stressors that influence initiation and continuation.

**TRENDS AND FACTORS RELATED TO YOUTH TOBACCO USE**

In Rhode Island high schools in 2019, female students reported current use of electronic vapor products (31%) at higher rates than male students (28%). Male students reported smoking cigarettes or cigars (6%) or using smokeless tobacco products (3%) at higher rates than female students (2% and 1%).

Despite tobacco industry marketing efforts targeting Black communities to initiate and continue smoking menthol tobacco products, Black high school students have historically reported using tobacco products at lower rates than their peers. In 2019, Black high school students reported the lowest rates of current e-cigarette use at 18%.

Students who identified as Black (18%), Hispanic (20%), or Other (32%) were all less likely to report current e-cigarette use than their White peers (36%).

Survey data of Rhode Island Native American youth is not available due to insufficient sampling, however, a national survey released in 2017 found that American Indian or Alaskan Native high school students reported higher rates of using any tobacco product including e-cigarettes (35%) than their Asian (6%), Black (15%), Hispanic (17%), and White (22%) peers. In some Native American communities, tobacco is used in ceremonial practices to protect and heal sick individuals and can be used as an educational tool linked to storytelling. Some tobacco companies target American Indian/Alaska Native communities through advertising campaigns featuring symbols or names with special meaning to this group or promote tobacco products as “natural” cigarettes.
### FACTORS INFLUENCING INITIATION AND USE OF TOBACCO PRODUCTS, INCLUDING E-CIGARETTES, AMONG YOUTH

#### MENTAL HEALTH

Youth who experience depression, anxiety, and stress are more likely to initiate smoking and become regular users.\(^{1,3,4}\) In 2019, 39% of Rhode Island high school students who reported feeling sad or hopeless also reported currently using e-cigarettes compared to 25% of their peers who did not report feeling sad or hopeless.\(^{15}\)

#### BULLYING

Both youth who bully others and youth who are victims of bullying have higher rates of tobacco use. These students may initiate use to gain peer acceptance and/or to relieve stress.\(^{16}\) In 2019, 42% of Rhode Island high school students who reported being bullied at school or online reported using e-cigarettes compared to 27% of students who did not report being bullied.\(^{17}\)

#### LGBTQ+ DISCRIMINATION

Discrimination, family rejection, emotional abuse, social stigma and isolation may contribute to higher rates of tobacco use among lesbian, gay, bisexual, and transgender youth, and youth who are unsure of their sexuality.\(^{18}\) In Rhode Island in 2019, 37% of lesbian, gay, and bisexual youth reported current e-cigarette use compared to 30% of their peers.\(^{19}\)

#### RURAL COMMUNITIES

Industry marketing that perpetuates a culture of tobacco in rural communities contributes to a social norm of smoking.\(^{20}\) In the 2013-2014 school year, 10% of rural high school students in Rhode Island reported currently smoking cigarettes compared to 9% of students statewide and 5% of students in the four core cities.\(^{21}\)

Notes: Feeling sad or hopeless is defined as two or more consecutive weeks in a row in the last 12 months in which the student felt so sad or hopeless they stopped doing some normal activities. Bullied is defined as being bullied on school grounds or electronically in the last 12 months. Use is defined as currently smoking a cigarette or using an e-cigarette at least one day during the 30 days before the survey. The Rhode Island Department of Health defines Burrillville, Coventry, Charlestown, Exeter, Foster, Glocester, Hopkinton, Jamestown, Little Compton, New Shoreham, Portsmouth, Richmond, Scituate, Tiverton, West Greenwich, and Westerly as rural communities. The four core cities are Central Falls, Pawtucket, Providence, and Woonsocket.

### ACCESS INFLUENCES YOUTH INITIATION

Experimentation with and initiation of tobacco products among youth can be attributed to the ease of access to tobacco products through retailers despite laws prohibiting sales to minors.\(^{22}\) In 2019, 39% of Rhode Island high school students under age 18 who use tobacco products reported purchasing tobacco products at a retail establishment.\(^{23}\) In FFY 2020, 13% of retail tobacco outlet inspections resulted in retailer violation.\(^{24}\)

Note: Retailer violations rates are the percentage of inspected retail outlets that sold tobacco products to an inspector under age 18.
